Sood, close protection of digital identities

Press release, La Rochelle, November 30, 2015

Sood is a software ecosystem designed to ensure individual identity associated with any document transmission and the authenticity of the information attached to these documents when necessary. The identity of an entity is now composed of a stack of documents and information held by trusted third parties that guarantee their authenticity unlinked to the identity of the holder. "Paper Identity" is now "digital identity" and is exposed to fraud and theft like never.

According to the Bureau of Justice Statistics, the total cost attributed to identity theft on the Internet in the US in 2012 would amount to 24.6 billion dollars against 13.9 billion for crimes against property. In France, each year 210,000 people are victims for a total cost for them and insurers of 500 million euros.

Sood quickly broken with the old logic of the protection piled on documents, so more and more complex and inefficient, digital certificates and cryptographic keys. These protection methods, focused on the transmission of the document, are naturally circumvented and fragile regarding identity warranty term. With Sood, no more original, paper or electronic, is flowing, the document remains on protected servers certified by the producer of the document. Sood merely allows, according to a logic of rights and only managed directly by the owner of documents (not the producer of the document but the person to whom it is intended) to open a temporary access tunnel to the original document. This secure "tunnel" opens only for the person holding the rights to the document, for the duration where the information associated with the document is useful to him. The latter has the full guarantee of the identity of the owner of the document by the use and existence of the tunnel.

Persons authorized to use the document are kept informed of the evolution of the information they authenticate within the limits defined by the document owner.

A consumer credit?

Payslips shared at the time of contract signature are active for the banker who will be authorized by his client to be informed of possible changes in income or breach of contract.

A family book?

The government will update the documents and related social rights over the changes ... The owner manages, with full control the use of all copyright holders related to its documents without any intrusion into personal data .

Sood address the worldwide market for data security solutions for companies and individuals. The Sood innovating solution is the answer to identity theft attempts, but also to all fraud using forged documents, concealment (obsolete authentic documents), and sometimes simple negligence. Sood is intended to become a global standard for security and authentication of documents through its unique technological approach, itself protected by numerous international patents.

The Sood solution is protected by international patents including US (Patent validated by the USPTO).
